The first two steps are relatively straightforward. The third step involves identifying the specific components of the system that are most likely to cause problems. This can be done by reviewing the design specifications and comparing them to the actual performance of the system. Once the problem areas have been identified, the next step is to develop a plan to address them.

The first two steps are relatively straightforward. The third step involves identifying the specific components of the system that are most likely to cause problems. This can be done by reviewing the system's design documentation, conducting interviews with users, or performing a detailed analysis of the system's behavior. Once the components have been identified, the next step is to develop a plan for testing each component. This plan should specify the test cases to be used, the expected results, and the criteria for passing or failing the tests.

The first two steps are relatively straightforward. The third step involves identifying the specific components of the system that are most likely to cause problems. This can be done by reviewing the design specifications and comparing them to the actual performance of the system. Once the problem areas have been identified, the next step is to develop a plan to address them.
